1. Executive Summary

Coma is a white-label community operating system built by MassaPro. Its tagline — “Building the Operating System for Communities” — captures the core ambition: any organization, vertical, or city community should be able to launch a fully branded, fully functional community platform in days rather than months, while sharing the infrastructure, codebase, and network effects of a single platform. The platform currently powers two brands: Coma itself, the parent platform hosted at platform.joincoma.com, and AI Salon, the first white-label customer community hosted at aisalon.massapro.com with active chapters in Tel Aviv and Montreal.

The platform covers the full lifecycle of a community: member acquisition through chapter landing pages and referrals, identity and access management, community discovery and multi-community membership, event management with RSVPs and check-in, email automation, knowledge management, and per-brand visual identity across every surface. Every capability is brand-scoped: two communities on the platform never see each other’s members, events, or content unless they choose to.

This document summarizes the platform’s goals, architecture, and current capabilities as of September 2026, and closes with the near-term roadmap. It is intended as a reference for stakeholders, new team members, and prospective community partners evaluating the platform.

2. Vision & Goals

2.1 The Problem Being Solved

Running a professional community today means stitching together a dozen disconnected tools: a website builder for the landing page, an events platform for RSVPs, a WhatsApp group for day-to-day conversation, a spreadsheet for the member database, an email tool for newsletters, and a design tool for event materials. Each tool has its own login, its own data silo, and none of them carry the community’s brand consistently. The result is operational overhead for organizers and a fragmented experience for members.

Coma replaces this patchwork with one platform where branding, members, events, emails, and content live together. A community lead configures their brand once — colors, logo, mascot, slogan, brand book — and every surface on the platform inherits it: the login page, chapter landing pages, event pages, transactional emails, and even the event-prep mockups.

2.2 Product Goals

- **White-label fidelity** — Make every surface reflect the community’s own brand, not the platform’s.

- **Time-to-launch** — A new brand can apply, be reviewed, and go live with its own identity in two business days. Skipped configuration inherits sensible Coma defaults.
- **Controlled openness** — Members of the parent platform can discover and join any community; members of a white-label brand see only their own brand's communities by default.
- **Community-led growth** — Referral links, testimonials, and interested-location personalization turn every member into a growth channel.
- **Operational leverage** — One codebase, one database, many brands. Adding a brand is a data operation, not a deployment.

2.3 Success Criteria

The platform's success is measured by the number of active brands provisioned, the time from application to first event, member-to-member connection rates inside each community, cross-community join rates for parent-platform members, and organizer-reported time saved per event cycle. The architecture is deliberately optimized for the first two: the brand-onboarding pipeline and the Coma-defaults provisioning model exist so that every additional brand costs near-zero marginal engineering effort.

3. Platform Architecture

3.1 Hierarchy Model

The platform organizes everything in a four-level hierarchy: Brand → Country → Chapter → Event. A Brand is a top-level identity (Coma, AI Salon, or any community that joins the platform). Under each brand, Countries group chapters geographically, and Chapters are the local communities members actually join — for example, AI Salon Tel Aviv or AI Salon Montreal. Events belong to a chapter and carry its branding, timezone, and venue context. The same chapter slug can exist under different brands, so “tel-aviv” can one day exist under both AI Salon and a hypothetical Danone community without collision.

Table 1 — Hierarchy entities and their roles

Entity	Purpose	Examples
Brand	Top-level white-label identity with full branding config	Coma, AI Salon
Country	Geographic grouping; drives nearby-community discovery	Israel, Canada

Entity	Purpose	Examples
Chapter	The local community members join; owns events and member lists	Tel Aviv, Montreal
Event	Gathering with RSVPs, agenda, speakers, check-in, photos	Salons, fast-pitch nights

3.2 Brand Resolution

Brand identity is resolved per-request through a four-layer chain: first an explicit brand parameter in the URL (?brand=xyz), then the request host (platform.joincoma.com resolves to Coma, aisalon.massapro.com to AI Salon), then the signed-in user's brand, then an environment default, and finally a hard fallback to Coma. This means every public link carries its brand with it — a Montreal member sharing an event link on WhatsApp shares an AI Salon link, and the recipient sees AI Salon branding even before they sign in.

3.3 Technology Stack

The platform is a Next.js 16 application deployed on Vercel, with a Neon serverless PostgreSQL database accessed through Prisma. Emails are sent through SMTP with a per-brand From identity. Images and brand assets are stored in Vercel Blob under per-brand prefixes. Analytics run through Google Analytics 4 and the Meta Pixel, both configurable per brand and loaded only after visitor cookie consent. The stack was chosen for zero-ops scaling: every deploy runs database migrations automatically, and adding capacity is handled by the platform rather than the team.

4. Core Capabilities

4.1 Brand System & White-Labeling

Every brand on the platform is a full configuration entity covering visual identity (primary, secondary, and accent colors, hero gradient, favicon, square logo mark, hero banner, email logo, and an optional mascot with name, image, and backstory), voice (tagline, login eyebrow, headline and subheading templates, footer credit), email identity (From name, contact address), and domain strategy. The login page, chapter landing pages, event pages, headers, footers, and transactional emails all render from this single configuration, so a brand is defined once and appears consistently everywhere.

Table 2 — Brand configuration surface

Category	Fields	Default when skipped
Identity	Display name, slug, wordmark, tagline	Wordmark from name; Coma tagline
Palette	Primary / secondary / accent hex, gradient	Coma navy / amber / red
Assets	Hero banner, favicon, logo, email logo URLs	Text wordmark; Coma assets
Character	Mascot name, image, backstory, brand book URL	No mascot; admin follows up
Login copy	Eyebrow, headline, subtitle, form heading, footer	Coma templates with brand name
Email	From name, contact email	Coma defaults on massapro.com

4.2 Communities & Membership

Chapters are the communities. Each member has one primary chapter (implicit membership) and can explicitly join additional communities through the platform. Joining is a one-click confirmation: the member's profile details are shown partially masked — the same way passwords are displayed — and a single Join button records the membership with the profile data captured server-side. A discovery page (/communities) lets members browse communities in their own country first, then worldwide, with search and country filters; each card shows member and event counts without leaking event details to non-members.

Access rules implement a deliberate openness model. Coma (parent platform) members can see every community's events, but must join a community before they can register for its events or see its member directory. Members of other brands see only their own brand's communities and events — an AI Salon member never discovers that a Danone community exists — preserving white-label isolation while keeping the parent platform's network open.

4.3 Events & RSVPs

Events are the heartbeat of each community. Each event has a public page with the brand's header and footer, agenda, speakers and panelists, venue and map links, photo gallery, and a registration card. Registration creates an RSVP with a unique check-in code; on the day of the event, door staff scan the code through the QR check-in surface. Event times render in the chapter's local timezone, so a Montreal event shows Eastern time regardless of where the viewer is. Members can upload photos to the shared event gallery, and testimonials with star ratings and photos feed back into the community's public credibility.

4.4 Member Experience

Members sign in with Google or email and password. Chapter landing pages (/c/slug) double as signup funnels: a visitor signing up through a chapter's page is automatically tagged to that chapter, country, and brand, and is asked for up to five locations they want community updates from — powering personalized discovery later. The member profile carries name, photo, bio, title, company, LinkedIn, and portfolio links, all editable from the profile page alongside the interested-locations picker. A member directory shows fellow members of each joined community with private one-on-one messaging.

4.5 Email System

Email runs on two layers. Transactional emails — password delivery, RSVP confirmations, direct-message notifications, onboarding invitations — resolve the recipient's brand at send time, so every email carries the right logo, colors, and From identity. The orchestration layer lets organizers build automated multi-step flows from reusable audiences, with A/B subject-line testing, per-step entry-event triggers, and campaign reporting broken down by template and subject variant. Five stage templates — awareness, reminder, final prep, day-of, and recap — come pre-seeded and are brand-tagged.

4.6 Knowledge Base & Event Prep

Each brand has its own knowledge base organized into sections — branding, marketing, event management, sponsorship, and governance — where Super Admins curate documents with editable titles, URLs, and visibility. AI Salon ships with a seeded library; new brands start empty and inherit nothing, keeping content strictly brand-scoped. For event preparation, the mockups hub generates on-brand speaker introduction cards, agenda cards, event profiles, meet-the-speaker graphics, and QR salon posters from the brand's asset library.

5. Onboarding & Application Flows

Two paths bring a new brand onto the platform, and both end in the same review-and-provision step. In the invite flow, a Super Admin emails a community lead a private link to a structured onboarding form. In the self-serve flow, a lead discovers the platform at /apply, signs in through the dedicated apply login, and completes an application form covering brand basics, color palette, logo and asset URLs, mascot details, brand book link, login copy, email configuration, and a launch plan with target date and first-chapter city.

Applications arrive in the Super Admin's brands console, where each submission is tagged by source — invited or self-applied — and can be reviewed in full before provisioning. Provisioning creates the Brand row with every submitted field applied and every skipped field inheriting the Coma default, links the new brand to the Coma hierarchy as a child, and activates it immediately. The lead receives

a chapter-is-live email with admin access. The one-application-per-user rule prevents duplicates, and submitted applications remain viewable by the applicant as a read-only record.

Table 3 — Onboarding paths

Path	Entry point	Review step	Typical time
Admin invite	Super Admin emails lead from brands console	Same queue	2 business days
Self-serve apply	/apply landing → apply login → application form	Same queue, “Apply” badge	2 business days

6. Roles, Administration & Analytics

Administration follows a five-role hierarchy. Super Admins manage the platform globally: brands, onboarding, countries, and brand-scoped settings. Admins manage members and content within their scope. Chapter Organizers and Co-Hosts run their own chapter’s events, speakers, and check-in. Members participate; Speakers have event-scoped preparation surfaces. A view-as switcher lets Super Admins preview the platform exactly as any role or chapter would see it.

Table 4 — Role hierarchy

Role	Scope	Key powers
Super Admin	Entire platform	Brands, onboarding, provisioning, all settings
Admin	Country or chapter scope	Members, events, emails, reports
Chapter Organizer	Own chapter	Events, speakers, check-in, event prep
Co-Host	Assigned events	Event-scoped speakers, registrants, check-in
Member / Speaker	Joined communities	RSVP, profile, gallery; speaker prep areas

Analytics operate at two levels. Platform analytics include GA4 and Meta Pixel, both brand-scoped and consent-gated, plus built-in dashboards for member activity, event performance, and referral attribution. The referral program gives every member a unique share link; visits, signups, and RSVPs driven by that link are attributed back to the member, making word-of-mouth measurable. Activity reports track visits, new visitors, and conversions per referrer so organizers can identify and reward their most effective ambassadors.

7. Current State & Roadmap

7.1 Live Today

As of September 2026 the platform runs two brands in production: Coma at platform.joincoma.com and AI Salon at aisalon.massapro.com. AI Salon operates chapters in Tel Aviv and Montreal with the full event lifecycle in active use. The complete capability set described in this document — brand separation across templates, images, knowledge base, and mockups; multi-community membership with gating; the self-serve apply flow; interested-location capture at signup; per-brand analytics configuration — is deployed and verified in production.

7.2 Near-Term Roadmap

Table 5 — Roadmap items

Item	Description	Status
DB-driven brand registry	Read brand config from the database instead of code, completing the path to fully self-serve brand creation	Next major phase
Mockup canvas brand-awareness	Mockup editors currently render canvas colors from the AI Salon palette; switch to per-brand palette tokens	Queued
Email flow brand columns	Add brand scoping to orchestration flows and audiences for non-event campaigns	Queued
Location-based discovery	Surface communities matching each member's interested locations at the top of /communities	Queued
Location-based notifications	Email members about new communities and events in their interested cities	Queued
Legacy cleanup	Remove the deprecated per-user brand string in favor of brand links; finish admin-copy brand-awareness	Ongoing

7.3 Strategic Position

The platform's defensibility rests on three compounding assets. First, the brand-configuration depth: every surface — down to email From lines and mockup canvases — is brand-aware, which is genuinely hard to replicate. Second, the network topology: the parent platform's members can flow into any community while white-label brands stay isolated, giving Coma a unique position as both infrastructure and a discovery network. Third, operational leverage: each new brand is a row, not a deployment, so the marginal cost of the tenth community approaches zero. The immediate roadmap concentrates on completing that promise — making brand creation a fully self-serve, database-driven operation — so that growth in communities translates directly into platform growth.
